

Nearly **70% to 80%** of chemotherapy patients experience **nausea and/or vomiting**(very common)

- subdivided into:-

1. **Acute phase:** within 24 hours of chemotherapy

2. **Delayed phase:** after 24 hours

3. **Anticipatory phase**, brought about by the anticipation of chemotherapy administration

- **Treatment** usually necessitates **more than one class of antiemetic**

Influencing factors:

- Type of chemotherapy ( mild e.g., methotrexate, moderate e.g., doxorubicin, severe emetic potential e.g., cisplatin)

- Patient variables (young patients and women > older patients and men)

Other variables like dose,schedule etc...

CINV affects:-

1. quality of life
2. lead to rejection of potentially curative chemotherapy.
3. can produce dehydration, profound metabolic imbalances, and nutrient depletion.

- Pathways of CINV:-

Peripheral → **serotonin(5HT3) dependent** → acute phase

Central → **dopamine(D2) and serotonin(5HT3)** → delayed phase

Drugs that antagonize **substance P and serotonin** are the **most potent**

#### **Motion sickness** antiemtics

H1-receptor antagonist ( antihistamine) e.g. dimenhydrinate, meclizine, cyclizine	Muscarinic receptor antagonist(anticholinergic) e.g Scopolamine
--------------------------------------------------------------------------------------	--------------------------------------------------------------------

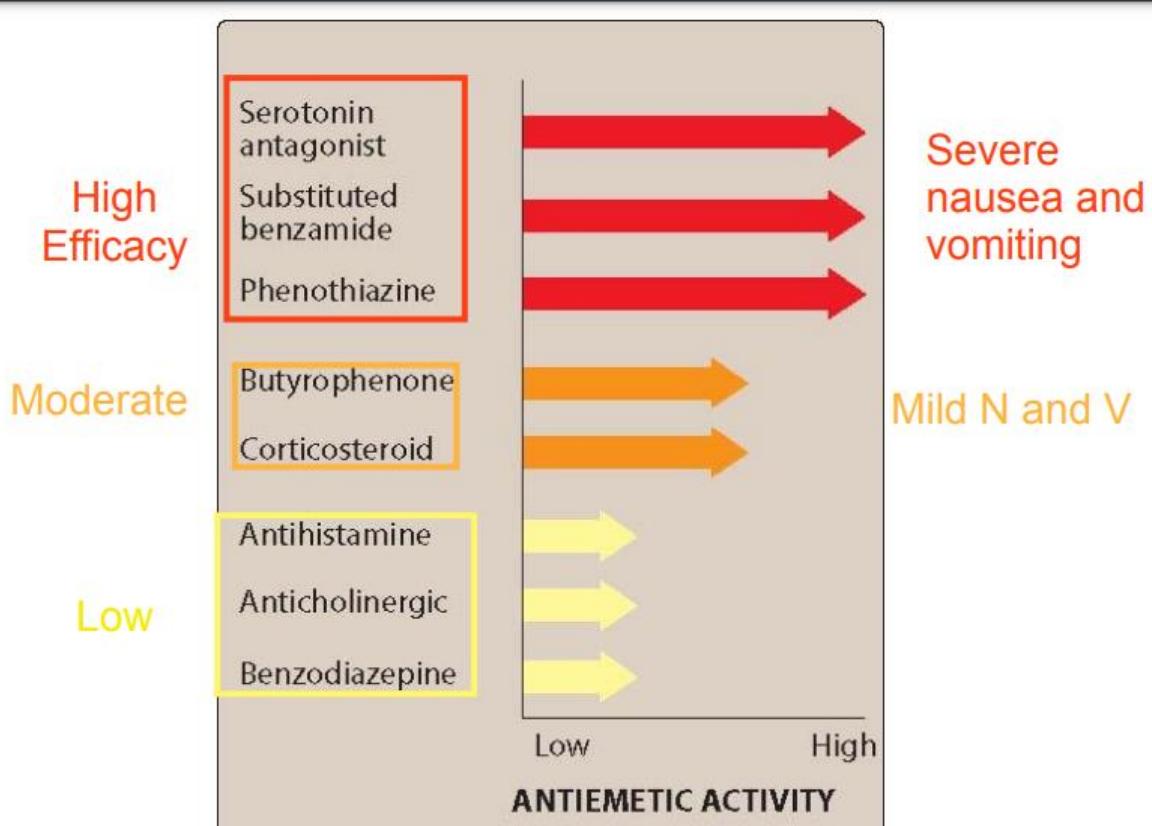

**Used for motion sickness but not chemotherapy induced vomiting**

### Main drugs for chemotherapy induced nausea and vomiting

Phenothiazines	5-HT3 Receptor Blockers	Substituted Benzamides	Butyrophenones	Substance P/neurokinin-1 receptor blocker
prochlorperazine	<ul style="list-style-type: none"> <li>Examples: ondansetron, granisetron, palonosetron, dolasetron.</li> </ul>	metoclopramide	<ul style="list-style-type: none"> <li>Examples: Droperidol and haloperidol</li> </ul> <p>Mnemonic: beautiful(butyrophenone) doll(drug ends with dol)</p>	<ul style="list-style-type: none"> <li>Example: Aprepitant, netupitant and rolapitant</li> </ul>
<ul style="list-style-type: none"> <li><b>Mechanism of action:</b>  <b>dopamine</b> receptor(D2) antagonism (<b>central</b>)</li> <li><b>Uses:</b>  Nausea and vomiting by <b>low to moderately</b> emetogenic chemotherapeutics So <b>can be used for methotrexate or doxorubicin but not preferred for cisplatin</b></li> <li><b>Adverse effects:</b>  <b>sedation, orthostasis(postural hypotension), and extrapyramidal effects.</b></li> <li><b>side effects are dose limiting</b></li> <li><b>Extrapyramidal effects(due to dopamine antagonism):</b>  an inability to sit still, involuntary muscle contraction(dystonia), tremors, stiff muscles, slowed movement (bradykinesia)</li> </ul>	<p><b>Mechanism of action:</b>  Selective <b>serotonin type 3 (5-HT3 )</b> receptor antagonism at <b>central (CTZ) and peripheral (visceral vagal afferent fibers)</b></p> <ul style="list-style-type: none"> <li><b>Uses:-</b>  <b>CINV largely because of their longer duration of action and superior efficacy.</b> ( single dose prior chemotherapy iv or orally)  <b>Postoperative and post-radiation nausea and vomiting</b></li> <li><b>Pharmacokinetics(important):</b> -  <b>Metabolized in the liver (only ondansetron requires dose adjustment in hepatic disease)</b> Excretion is via urine</li> <li><b>Adverse effects:</b>  <b>Prolongation of QT interval:</b> • occur with <b>dolasetron and high doses of ondansetron</b>. For this reason, <b>dolasetron is no longer approved for CINV prophylaxis</b>.</li> <li><b>Baseline ECG is recommended prior to starting therapy</b></li> </ul>	<ul style="list-style-type: none"> <li><b>Mechanism of action:</b>  <b>dopamine</b> receptor (D2 ) antagonism (<b>central</b>)</li> <li><b>Uses:-</b>  emesis, CINV(mild to moderate by methotrexate) and <b>diabetic gastroparesis</b> as it induce <b>gastric motility</b>.</li> <li><b>Adverse effects:-</b>  sedation, headache, diarrhea, <b>extrapyramidal symptoms</b> ( which limits long term and high-dose use)</li> </ul>	<ul style="list-style-type: none"> <li><b>Mechanism of action:</b>  <b>dopamine</b> receptor Antagonism(<b>central</b>)</li> <li><b>Uses:</b>  CINV,The butyrophenones are <b>moderately effective antiemetics</b>.(can be used in combination with other drugs)</li> <li><b>May prolong the QT interval</b> and should be reserved for patients with inadequate response to other agents.</li> <li><b>Very important:</b>  <b>don't give butyrophenones with ondansetron</b>!!--&gt; <b>higher chances of QT prolongation</b>.</li> <li><b>"High-dose haloperidol was found to be nearly as effective as high-dose metoclopramide in preventing cisplatin-induced emesis.</b></li> </ul>	<ul style="list-style-type: none"> <li><b>Mechanism of action :</b>  <b>Antagonizes the neurokinin receptor in the brain</b> and blocks the actions of the <b>natural substance P</b></li> <li><b>Uses(important):</b>  <b>only for CINV caused by highly/moderately emetogenic chemotherapy(like cisplatin)</b></li> <li><b>Important:-</b>  <b>Metabolized by CYP3A4</b>, and it <b>may affect the metabolism of other drugs that are metabolized by this enzyme</b>, such as warfarin and oral contraceptives.</li> <li>Side effects(not important)</li> </ul>

typically due to problems in the basal ganglia or its connections.				
--------------------------------------------------------------------	--	--	--	--

bonus drugs for CINV	
<b>Benzodiazepines</b> <ul style="list-style-type: none"><li>• Examples: lorazepam, alprazolam</li><li>• <b>Low</b> antiemetic potential</li><li>• Mainly anxiolytic/amnesic → <b>useful for the treatment of anticipatory vomiting</b></li></ul>	<b>Corticosteroids</b> <ul style="list-style-type: none"><li>• Examples: dexamethasone and methylprednisolone</li><li>• Unknown mechanism.</li><li>• Effective against <b>mildly to moderately</b> emetogenic chemotherapy.</li><li>• <b>They are used in combination with other agents</b>(Synergistic effects(1+1=3)</li></ul>

## Combination Regimens(very important)

- Combinations either **increase antiemetic activity or decrease toxicity/adverse effects**

- **Dexamethasone(corticosteroids)** **increases antiemetic activity** when given with high-dose metoclopramide, 5-HT3 antagonist, butyrophenone, etc.

**Dexamethasone** also **reduces diarrhea adverse effect**

- **Antihistamine** + high-dose metoclopramide to **decrease extrapyramidal adverse effects.**

## Cannabinoids (CB)

- In humans 2 subtypes of CB receptors have been exclusively identified namely CB 1 and CB 2.
- The antiemetic effects of cannabinoids like nabilone appear to be **due to the interaction of CB1 receptor**
- **Marijuana (medical marijuana) use as an antiemetic: controversial**
- **Synthetic e.g., nabilone: approved as second line or for the treatment of breakthrough(non-responsive) CINV**
- Additionally, nabilone may also **indirectly and partially manipulate 5-HT 3 and D 2 receptors.**

## Antiemetic in pregnancy

- **Initial treatment is conservative(non-pharmacological)** and includes dietary changes, emotional support, and **vitamin B6 supplementation(pyridoxine).**
- **Combination therapy with vitamin B6 and doxylamine reduces nausea and vomiting by 70%.**
- If unsuccessful ,**use 5HT3 receptor blocker as ondansetron**
